

SUCCESS STORY

VIBRACOUSTIC, FORSHEDA SWEDEN

Efficient internal logistics and reduced forklift traffic at work thanks to two strategically located units of 9020 in the top-modern factory at Vibracoustic, Forsheda.

VIBRACOUSTIC, FORSHEDA in Sweden is supplying anti-vibration solutions for the automotive industry.

Exporting worldwide

These products add comfort and contribute to an enhanced driving experience. The components are high in demand in the automotive industry and Vibracoustic, Forsheda delivers them to major car manufacturers in Europe, Asia and North America.

Top-modern factory

The Forsheda factory is top-modern and provides highly automated production and an orderly and inviting working environment.

To further enhance the efficient and modern production facility, Vibracoustic, Forsheda invested in a new waste handling solution; two units of Orwak Multi 9020.

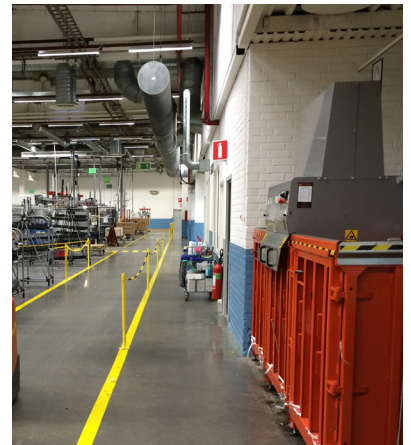

Both machines have a central and strategic location – one in the factory next to the production lines and one in the warehouse. Both balers are three-chamber applications for cardboard, plastic foil and a rest fraction that goes to incineration.

Improved logistics and safety

The new solution has significantly improved internal logistics. Before the investment, waste was thrown in open containers, which had to be brought outside frequently to be emptied in larger containers. Nowadays, there is significantly less internal traffic and a small electric train picks up and transports the bales to the backyard.

“Our ambition was not only to make our internal logistics processes more efficient but also to decrease the forklift traffic in the factory.”

Christer Wallin, Quality - & Environmental Manager at Vibracoustic, Forsheda

Conveniently located next to the production lines

The small electric train supplies components and removes the bales.
